Safety Information

General

The following general safety precautions must be observed during all phases of operation and service of this instrument. Failure to comply with these precautions or with specific warnings elsewhere in this manual violates safety standards of design, manufacture, and intended use of the instrument. RTX A/S assumes no liability for the customer's failure to comply with these requirements.

DO NOT operate the product in an explosive atmosphere or in the presence of flammable gasses or fumes.

DO NOT use repaired fuses or short-circuited fuse holders: For continued protection against fire, replace the line fuse(s) only with fuse(s) of the same voltage and current rating and type.

DO NOT perform procedures involving cover or shield removal unless you are qualified to do so — it is therefore strongly emphasized here that operating personnel must not remove equipment covers or shields. Procedures involving the removal of covers and shields are for use by service-trained personnel at RTX A/S only.

Electrostatic Discharge

Electrostatic discharge (ESD) can damage electronic test equipment. Working with electronic components or test equipment should always be performed at a static-safe place.

High Voltage

Some power supplies can generate high voltage, which can damage any of the ports of the unit.

To prevent damage to the RTX2041 Nexus ICE-III please make sure that the device is properly earthed.

2 Introduction

2.1 About RTX Nexus ICE-III

RTX Nexus ICE-III is a target interface unit for the ARM's Cortex-M or NSC's CR16C architectures. It enables you to debug software via the SWD or SDI+ interface pins.

RTX Nexus ICE-III unites 2-wire SWD, 1-wire JTAG (SDI+), UART and galvanic isolation in a single box, providing the full functionality needed for both Dialog SC14xxx and DA14xxx series processors.

The RTX Nexus ICE-III product comprises:
- An interface unit that connects a USB port of a PC to the JTAG and/or UART interfaces of a processor that includes SWD or SDI+ debug capability.
- A standard USB A to mini-B cable.
- Software available from the download section at https://www.rtx.dk/.
- The software package includes the following components:
  - Virtual COM port driver
  - Debugger interface driver
  - a Dynamic Link Library (DLL) to use with the debugger
  - the RTX Nexus Debugger

2.2 Availability

RTX Nexus ICE-III is available from RTX A/S. Contact RTX sales (http://www.rtx.dk/) for pricing.

Software upgrades are available free of charge from the download section at https://www.rtx.dk/.

2.3 Compatibility

The UART is exposed as a standard COM port on the PC and can be used as any other COM port.

The debugger interface can currently only be used with the RTX Nexus Debugger.

3 System Setup

3.1 Installation

The software for the RTX Nexus Debugger and RTX Nexus ICE-III runs on Windows 7 or newer.

1) **Install software**. Run Nx4Setup_vxx.exe to install the RTX Nexus Debugger. This also pre-installs the USB drivers needed for RTX Nexus ICE-III.

2) **Connect USB cable**. Connect RTX Nexus ICE-III to the PC using a standard USB A to mini-B cable.
   Windows now automatically installs the USB drivers for RTX Nexus ICE-III. A new COM port also appears.

3) **Update Firmware**. Run the RTX Nexus Debugger. If new firmware is available for RTX Nexus ICE-III, it will be updated automatically.

4) The system is now ready for use. You can now connect the target and configure RTX Nexus Debugger.

3.2 The RTX Nexus ICE-III interface unit

3.2.1 Rear side connectors

The rear side on the box has a USB connector. It used to connect RTX Nexus ICE-III to a PC using a standard USB A to mini-B cable. The RTX Nexus ICE-III hardware is powered from the USB connector.

3.2.2 Front side connectors

The front side has the connectors for the target device. These are galvanic isolated from the PC USB connection.

- **20-pin header**: I/O ports for UART, SWD and 1-wire JTAG. See pin out reference in section **Error! Reference source not found.**.

- **Button**: The JTIO and RXD pins are pulled low while the button is pressed. This used for bringing SC14xxx/DA14xxx targets into boot mode.

- **Blue LED**: On when RTX Nexus ICE-III is powered on and idle.

- **Green LED**: On when RTX Nexus Debugger is active. Flashes during JTAG communication.

- **Red LED**: On when COM port is open. Flashes during UART communication.
